

# ENVIRONMENTAL REPORT 2017

Juin 2018

## **The voluntary commitment agreement (CEV -** *convention d'engagement volontaire*) for road infrastructures...

Following the Environment and Energy Transition Round Table a voluntary commitment agreement involving the main actors in designing, constructing, and maintaining road infrastructures, streets, and urban public spaces was signed on 25 March 2009.

By this agreement the **excavation and road construction** enterprises together with their partners (Assemblée des Départements de France and Syntec Ingénierie) under the aegis of the FNTP (Fédération Nationale des Travaux Publics - National Federation of Public Works) and their speciality syndicates undertook – among other commitments - to:

- Reduce greenhouse gas emissions by 33% by 2020 through:
  - o generalising warm mixes
  - o increasing the use of maintenance solutions based on bitumen emulsion
  - o reducing emissions at the level of asphalt plant production
- Reuse or recycle 100% of the materials excavated on the work sites by 2020 and preserve the non-renewable resources, especially through:
  - o increased recycling of surpluses and waste from work sites
  - $\circ$   $\,$  increasing the rate at which bituminous materials from road deconstruction are reused
- Reach an industrial tools certification rate of 50 %
- Create and develop an environmental software common to the public works enterprises in order to assess the impact of public works: **SEVE** Eco-comparator

This environmental report for 2017 shows the road building companies renewed efforts to attain these principal objectives.

#### \*\*\*\*\*\*

#### SUMMARY

1	French production of asphalt concrete	2
	1.1 The tonnage	2
	1.2 Evolution of the distribution of production	
2	French production of warm and semi-warm mixes	
3	National production of bitumen emulsions	
	3.1 Spreading emulsions	
	3.2 Coating emulsions	
4	Valorization of recycled materials	
5	Average rate of reintroduction of RAP in bituminous mixes	
6	In-place recycling	
7	Greenhouse gas emission (kg CO <sub>2</sub> éq.)	
8	ISO 14001 certified asphalt concrete plants and bituminous emulsion factories	
9	Deploying SEVE Eco-comparator	
10	Conclusion	

## **1** French production of asphalt concrete

### 1.1 The tonnage

This refers to the whole tonnage manufactured **Erreur ! Source du renvoi introuvable.** for hot, warm / semi-warm, and cold mixes (by calculating their proportions). The proportions are calculated according to the following formula:

#### Company tonnage = $\Sigma p_i x t_i$

p<sub>i</sub>: participation of the enterprise in entry i ti: tonnage produced in entry i

Asphalt concrete tonnage in France 2011-2017							
Year	Hot mixes	Warm mixes	Cold mixes <sup>1</sup>	Total France			
2011	36 100 000	1 259 000	1 600 000	38 959 000			
2012	31 733 000	2 633 000	1 460 000	35 826 000			
2013	31 850 000	3 550 000	1 550 000	36 950 000			
2014	28 698 500	4 023 300	1 418 300	34 140 100			
2015	25 916 000	4 552 000	1 832 500	32 300 500			
2016	29 277 600	4 324 200	1 858 300	35 460 100			
2017	29 838 000	3 824 000	1 977 000	35 857 000			

#### Table 1. Detailed trends of the tonnage of asphalt concrete in France 2011-2017

The Figure 1 shows the trend of the French asphalt concrete production since 2011.

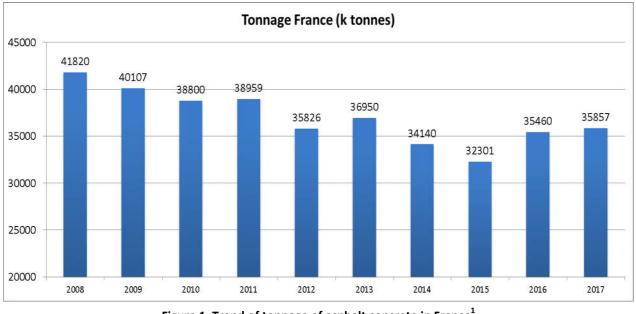

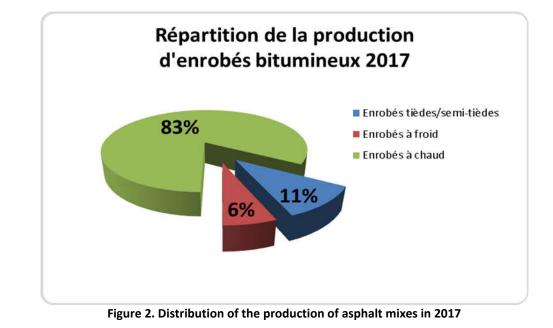

Figure 1. Trend of tonnage of asphalt concrete in France<sup>1</sup>

<sup>1</sup> This figure includes all gravel emulsion and cold bituminous mixes.

Routes de France | Bilan Environnemental 2017

## **1.2** Evolution of the distribution of production

The Figure 2 shows the distribution of the production of hot, warm and cold mixes in 2017.

The Figure 3shows the distribution of the production of hot, warm and cold mixes from 2013 to 2016.

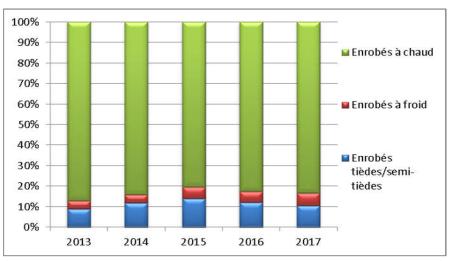

Figure 3. Distribution of asphalt mixes production 2013-2017

## 2 French production of warm and semi-warm mixes

An asphalt concrete is called a warm mix asphalt when – for a given usual road bitumen, a hard bitumen or special bitumen – the process enables the coating temperature to be diminished by at least 30°C below the maximum acceptable temperature for the bitumen while still being above 100°C. The asphalt concrete is a semi-warm mix when the process allows production at a temperature between 85°C and 100°C<sup>2</sup>

<sup>2</sup> According to the definition of the Guide IDRRIM "Enrobés Tièdes (Warm Coatings)" (2015)

Routes de France | Bilan Environnemental 2017

CEV's goal for 2012 was to reach a tonnage of **1 500 000 tons**. This goal was met and even exceeded expectations with **2 633 000 tons**.

**In 2017**, the production of warm and semi-warm mixes has been very largely exceeded the 2012 goal to reach a tonnage of **3 824 000 tons**, i.e. an **increase of 45%** compared to 2012. However, a decrease of 12% in their production is observed compared to 2015. The Figure 4 shows how this tonnage has evolved since 2008.

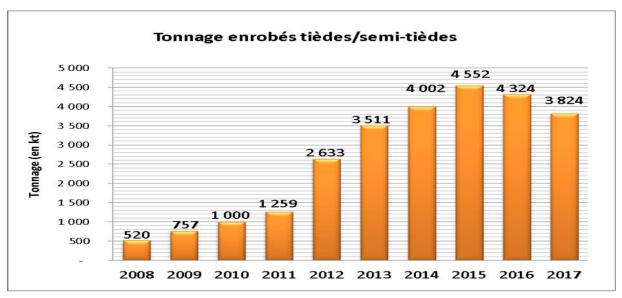

Figure 4. Evolution of the tonnage for warm and semi-warm mixes 2008-2017

## **3** National production of bitumen emulsions

The tonnage for the emulsions below only concerns the members of the SFERB.

Table 2. Emulsions tonnage (c	oating + spreading) of SFERB members
-------------------------------	--------------------------------------

	SFERB emulsions tonnage (coating + spreading)
2017	729 052
2016	720 593
2015	723 620
2014	731 100
2013	801 600
2012	747 780

The production for the factories other than SFERB members 2014 (also including those managed by the administration) is estimated at 58 000 tons for 2017 against 67 000 tons for 2016. These data are not considered in this report because it is not possible to differentiate their practices in coating or spreading techniques.

### 3.1 Spreading emulsions

In this category all the tonnages for emulsions for tack coats, curing and sealing works as well as for Surface Dressing (ESU - *Enduits Superficiels d'Usure*) are considered. The Table 3 details these tonnages.

Z	Tons of emulsions for tack coats	Tons of emulsions for surface dressing	Tons of emulsions for curing / sealing	Total tons of spreading emulsion
2017	127 000	292 500	127 000	546 500
2016	117 000	323 000	117 000	557 000
2015	108 000	334 000	108 000	550 000
2014	115 000	326 000	115 000	556 000
2013	131 000	356 000	131 000	618 000
2012	130 000	325 000	130 000	585 000

#### Table 3. Detailed tonnage for spreading emulsions of SFERB members

Thus for the year 2017, the area covered by Superficial wear coatings (ESU) emulsion can be estimated at 146 million  $m^2$  and **171 million m^2** all techniques combined.

#### 3.2 Coating emulsions

In this category all the tonnages for emulsions produced for manufacturing emulsion coatings (gravel emulsion, cold mix asphalt and in place micro surfacing) are considered. The Table 4 details these tonnages.

#### Table 4. Detailed tonnage for coating emulsions of SFERB members

	Tons of emulsions for Gravel Emulsion and Cold Mix Asphalt	Tons of emulsions for In place cold mix surfacing	Total tons - coating emulsions
2017	138 390	44 162	182 552
2016	120 400	43 193	163 593
2015	122 600	51 020	173 620
2014	98 000	77 100	175 100
2013	107 800	75 800	183 600
2012	102 200	60 580	162 780

As a reminder, the tonnage for cold mixes manufactured in plant (Gravel Emulsion and cold mix asphalt) for 2017 is 1 977 000 tons.

The tonnage of emulsions used for in place micro surfacing is estimated at 44 162 tons, i.e. **46** million m<sup>2</sup> road surface covered by this technique.

## 4 Valorization of recycled materials

The tonnage includes all the recycled materials (bituminous chippings and crushed crust and concrete for subsequent use). The

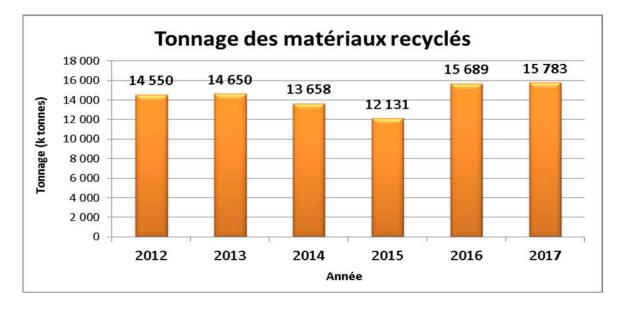

Figure 5 gives these tonnages since 2012.

#### Figure 5. Tonnage for recycled materials

**In 2017**, the tonnage of recycled materials slightly increased (0,6%) compared to 2016 and therefore remains at the level of those of the years 2012 and 2013.

## New indicator implemented in 2016: number of recycling platforms managed by the road industry

In order to properly account for these materials managed by the road industry, a new indicator is set up in 2016. It is the number of recycling platforms in the road industry. In 2017, more than 679 recycling platforms were counted for a tonnage of more than 15,783,000 tons. Asphalt aggregates are part of this tonnage, and 6,452,000 tons were reused in new mixes.

## Recycling platforms: 679 Recycled materials: 15 783 000 tons Reclaimed asphalt pavement: 6 452 000 tons

## 5 Average rate of reintroduction of RAP in bituminous mixes

CEV's goal for 2017 is to reach a rate for reintroducing RAP in the formulas of at least **15%**. The average rate of reintroduction of RAP in asphalt concrete (hot&warm mixes) is around 18,4% for 2017. This rate has increased considerably between 2010 and 2013 but has stagnated since 2014 with a very little increase in 2015 as shows in Figure 6:

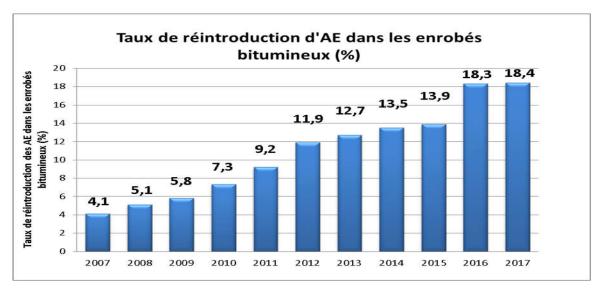

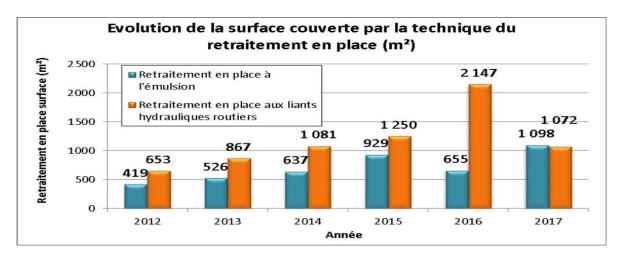

Figure 6. Evolution of the rate of RAP in asphalt concrete (%)

## 6 In-place recycling

This indicator corresponds to all the tons of road surfaces in-place recycled by bituminous binders (emulsion + foam) or road hydraulic binders. The monitoring of this indicator started in 2012 with its addition the CEV's monitoring survey. In Table 5, the indicator is expressed in  $m^2$  and tons<sup>3</sup>.

<sup>&</sup>lt;sup>3</sup> The values in m2 of recycled pavements in place are calculated using thicknesses of 8 cm for emulsion technique and 20 cm for road hydraulic binder technique as assumptions..

		In place cold recycling with bituminous emulsion or foam bitumen	In place recycling with road hydraulic binders			
2017	tons	197 478	482 197			
2017	m²	1 097 614	1 071 549			
2016	tons	117 755	965 969			
2010	m²	654 500	2 146 800			
2015	tons	167 172	562 314			
2015	m²	928 700	1 249 600			
2014	tons	114 700	486 500			
2014	m²	637 500	1 081 200			
2012	tons	94 750	390 120			
2013	m²	526 400	867 000			
2012	tons	75 290	293 740			
2012	m²	418 800	652 800			

Table 5. Tonnage for in place recycling (emulsions or hydraulic binders)

Those two techniques show an overall increase of around 700 000 m<sup>2</sup> par compared to the surfaces accounted for in 2016. In 2017, the surfaces are equivalent to those evaluated in 2015. The year 2016 seems atypical regarding the in-place recycling using hydraulic binders. The percentage of pavement reprocessing with emulsion has increased (+18 %) compared to 2015

The interest of these techniques is twofold:

- Preservation of the resource of new materials.
- Removal of transport related to the routing of new materials.

## 7 Greenhouse gas emission (kg CO<sub>2</sub> éq.)

This indicator corresponds to the greenhouse gas emissions expressed in kilogramme  $CO_2$  equivalent per tonne of asphalt concrete produced. This calculation only takes into account the consumption of burner fuel (fuel-oil, natural gas, or lignite).

The Figure 8 shows the evolution of GHG emissions since 2009.

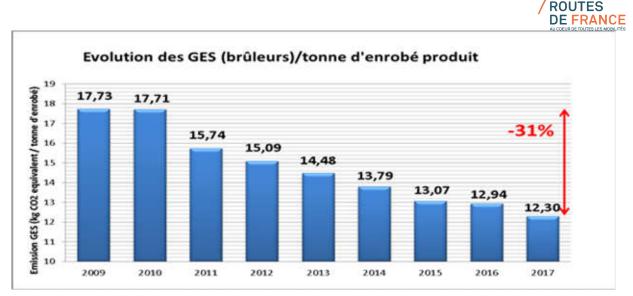

Figure 8. Evolution of greenhouse emissions (dryers consumption)/ asphalt concrete ton produced

For 2012, CEV's goal was **16,84 kg CO<sub>2</sub> eq** / asphalt concrete ton produced. With an average value of **15,09 kg CO<sub>2</sub> eq** / asphalt concrete ton produced in 2012. The goal fixed was reached. The value of 2017 shows a steady decline with the average value of:

#### 12,30 kg $CO_2$ eq / asphalt concrete ton produced.

A reduction of 31% compared to 2009 is noted. The 2020 goal is to reduce greenhouse gas emissions by 33% compared to 2009. Efforts are still needed to achieve this value.

## 8 ISO 14001 certified asphalt concrete plants and bituminous emulsion factories

The objective of the CEV for the year 2012 was to reach a certification rate of industrial tools of 50%. This goal has been achieved. Since then, this value kept growing and reached 63% for ISO 14001-certified stations and factories. Table 6 shows the evolution since 2012 of asphalt mixing plants and ISO-14001 certified binder plants.

2017	63% ISO 14001 certified asphalt concrete plants				
2016	63% ISO 14001 certified asphalt concrete plants				
2015	63 % ISO 14001 certified asphalt concrete plants				
2014	63 % ISO 14001 certified asphalt concrete plants				
2013	62 % ISO 14001 certified asphalt concrete plants				
2012	61 % ISO 14001 certified asphalt concrete plants				

Table 6. Trend of ISO 14001 certification of plants and factories

## 9 Deploying SEVE Eco-comparator

SEVE is one of the tools of the voluntary commitment agreement signed by the Profession in 2009. The Table 7 shows the trend for deploying SEVE in France since its launch in 2012.

The Table 7 shows a new increase in the use of the software between 2017 and 2018. In October 2016, the SEVE software has been upgraded to version 3 which is integrating a module earthworks and new indicators. In addition, its highlighting in the issue of October 2016 of "Guide de l'achat public", co-published by ADEME and the Ministry of Ecology and Finance, gives it all the legitimacy to be used in the framework of the invitations to tender.

Statistique SEVE	2012	2013	2014	2015	2016	2017	<b>2018</b> <sup>4</sup>

Nombre de visites mensuelles	868	1090	1101	1735	1729	1794	1687

#### Table 7. Evolution of the SEVE Eco-comparator deployment since 2012

The development of version V3 in connection with the new European Directive on Public Procurement was carried out within a European project "SustainEuroRoad". SEVE will also be available in an "international" version. This project ends at mid-2018. It will include the following languages: German, Spanish and Hungarian.

10

<sup>&</sup>lt;sup>4</sup> Au 19/03/2018

<sup>&</sup>lt;sup>5</sup> De nombreux maîtres d'ouvrages lancent des marchés de travaux avec SEVE sans être abonnés

## **10 Conclusion**

As a reminder, here are the main objectives for the period **<u>2017 - 2020</u>**:

- 2017: Achieve a reintroduction rate of asphalt aggregates in formulas of at least (2017: 18,4% RAP)
- 2020 : Reduce GHG emissions (to burners) by 33% by 2020 compared to 2009 (2017 : decrease of 31% - 12,30 kg CO<sub>2</sub> / ton of mix)
- 2017 : Achieve a proportion of warm mixes in the total production of 30% (2017 : 11% of total tonnage) As a reminder, the percentage (warm + cold) reaches 20% in 2015
- To deploy the eco-comparator SEVE

Given these results, the Road Profession is continuing to progress towards the objectives it has set itself and is pursuing this improvement, except for warm mix asphalts. Indeed, an effort needs to be done on the part of the warm mix asphalt for the rate of 30% to be reached in 2017. This effort will require the involvement of the signatory prescriber project managers of the national CEV as well as local.

To help them, the finalization of the revision of the standard "Terminologie" NF P98-149 clearly defining the warm mixes, and more generally classifying the mixes by temperature ranges is eagerly awaited.
